

How Can I Protect My Child or Teen Against Hepatitis B?

You can protect your child with hepatitis B vaccine. Hepatitis B vaccine has been shown to be a very safe vaccine. Your child will get three shots of hepatitis B vaccine over a period of about six months. It can be given at the same time as other recommended childhood vaccines.

Washington State law requires the three-shot series of hepatitis B vaccine for children in preschool or childcare and children entering kindergarten. Exemptions are available in Washington State for medical, religious or personal reasons.

The Washington State Department of Health recommends the three-shot series of hepatitis B vaccine for infants, 11 and 12 year olds, teenagers who have a high risk of exposure, and any teenager whose doctor recommends it.

Where Can I Take My Child for Hepatitis B Vaccination?

Your doctor's office, a community health care facility, or a city or county public health department can immunize your child against hepatitis B or provide information on a location. It's best to call ahead of time to make sure vaccine is available. For more information about immunizations and where to get them, call

What Parents Need to Know about Hepatitis B

Hepatitis

Why Hepatitis B?

An estimated 200,000 people are infected with hepatitis B each year in the U.S. At least half of them have no symptoms and may not know they have it. Yet they are able to spread it to others. This means that *everyone* is at risk of getting hepatitis B—infants, children, teenagers and adults.

As of September 1997, hepatitis B vaccine is required by state law for children in preschool and childcare and children entering kindergarten. Exemptions are available for medical, religious or personal reasons in Washington State. Because hepatitis B vaccine is given as a series of three shots over a period of about six months, plan ahead to make sure your child is immunized before starting school, preschool or childcare. Call for a doctor's appointment today.

What is Hepatitis B?

Hepatitis B is a serious disease caused by a virus that attacks the liver. It can cause severe illness and death. The virus can remain in the body for a lifetime and cause ongoing liver damage and even cancer.

The younger a person is when they get hepatitis B, the greater the likelihood that they will become a carrier and suffer from chronic liver disease or liver cancer later in life. Infants born to mothers with hepatitis B have up to a 90% chance of becoming infected. Ninety percent of the infants infected at birth become hepatitis B carriers. Up to 25% of these carriers will die of liver disease as adults.

How is Hepatitis B Spread?

Hepatitis B is spread from person to person by direct contact with infected blood or body fluids. Even small amounts of infected blood can cause infection.

Hepatitis B can be spread by:

- an infected mother to her baby during childbirth
- sharing toothbrushes, needles or razors that belong to an infected person
- using body piercing or tattooing equipment that has not been sterilized
- having sex with a person who has hepatitis B
- occupational exposures (e.g. lab worker, law enforcement, EMT, etc.)

You do not get hepatitis B if you hold hands with an infected person or if an infected person sneezes or coughs near you.

Dear Colleague,

The Washington State Department of Health (DOH) is pleased to provide camera-ready art for printing this educational material. To ensure that the original quality of the piece is maintained, please read and follow the instructions below and the specifications included for professional printing.

- **Use the latest version.** DOH materials are developed using the most current information available, are checked for clinical accuracy, and are field tested with the intended audience to ensure they are clear and readable. DOH programs make periodic revisions to educational materials, so please check this web site to be sure you have the latest version. DOH assumes no responsibility for the use of this material or for any errors or omissions.
- **Do not alter.** We are providing this artwork with the understanding that it will be printed without alterations and copies will be free to the public. Do not edit the text or use illustrations or photographs for other purposes without first contacting us. Please do not alter or remove the DOH logo, publication number or revision date. If you want to use a part of this publication for other purposes, contact the Office of Health Promotion first.
- **For quality reproduction:** Low resolution PDF files are intended for black and white or color desktop printers. They work best if you are making only one or two copies. High resolution PDF files are intended for reproducing large quantities and are set up for use by professional offset print shops. The high resolution files also include detailed printing specifications. Please match them as closely as possible and insist on the best possible quality for all reproductions.

If you have questions, contact:
